## SAC Calculation

To calculate your Surface Air Consumption (SAC), the amount of gas consumed in bar while you are breathing for one minute on the surface, use the following formula:

- Start cylinder pressure
- Subtract end cylinder pressure
- Multiply by cylinder size
- Divide by dive time gives RMV
- Divide by pressure at depth (depth / $10+1$ ) gives SAC

Over time your SAC rate will decrease as your breathing becomes more controlled.
Example:

| Gas <br> In | Gas <br> Out | Used | Cylinder <br> Size | Ltr <br> Used | Dive <br> Time | ATAj <br> Depth | RMV | SAC |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 230 | 100 | 130 | 12 | 1560 | 45 | 2.5 | 34.67 | 13.86 |

$230-100=130$
$130 * 12=1560$
$1560 / 45=34.67$ RMV

RMV / 2,5 = 13.86 SAC
